# **4 Register Allocation**

### Use of registers:

- 1. intermediate results of expression evaluation
- 2. reused results of expression evaluation (CSE)
- 3. contents of frequently used variables
- 4. **parameters** of functions, **function result** (cf. register windowing)
- 5. stack pointer, frame pointer, heap pointer, ...

# Specific allocation methods for different context ranges:

- 4.1 expression trees (Sethi, Ullman)
- 4.2 basic blocks (Belady)
- 4.3 control flow graphs (graph coloring)

**Number of registers is limited** - for each register class: address, integer, floating point

### Register allocation aims at reduction of

- number of memory accesses
- spill code, i. e. instructions that store and reload the contents of registers

**Symbolic registers:** allocate a new symbolic register to each value assignment (single assignment, no re-writing); defer allocation of real registers to a later phase.

### Lecture Compilation Methods SS 2013 / Slide 401

### **Objectives:**

Overview on register allocation

### In the lecture:

Explain the use of registers for different purposes.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5

## ....

### Register windowing:

- Fast storage of the processor is accessed through a window.
- The n elements of the window are used as registers in instructions.
- On a call the window is shifted by m<n registers.
- Overlapping registers can be used under different names from both the caller and the callee.
- Parameters are passed without copying.
- Storage is organized in a ring;
   4-8 windows; saved and restored as needed

Typical for Risc processors, e.g. Berkley RISC, SPARC

### **Lecture Compilation Methods SS 2013 / Slide 402**

### **Objectives:**

© 2002 bei Prof. Dr. Uwe Kastens

Understand the technique of register windowing

### In the lecture:

Explain the technique.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5

### Suggested reading:

Lecture "Grundlagen der Rechnerarchitektur"

### **Questions:**

• Describe a situation when large runtime costs are caused by save and restore of the ring storage.

# **Activation Records in Register Windows**

- Parameters are passed in overlap area without copying.
- Registers need not be saved explicitly.
- If window is too small for an activation record, the remainder is allocated on the run-time stack; pointer to it in window.

parameters
static link
return address
dynamic link
local variables
register area
call area

shift on call

### Lecture Compilation Methods SS 2013 / Slide 403

### **Objectives:**

© 2002 bei Prof. Dr. Uwe Kastens

Use of register windowing

### In the lecture:

- Explain how the technique is used.
- Explain the relation to the run-time stack.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5

#### **Questions:**

• Under what restriction can the register windows completely substitute the activation records of certain functions?

# 4.1 Register Allocation for Expression Trees

### **Problem:**

Generate code for **expression** evaluation.

**Intermediate results** are stored in registers.

Not enough registers:

spill code saves and restores.

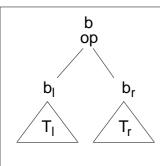

### Goal:

Minimize amount of spillcode. see C-4.5a for optimality condition

### Basic idea (Sethi, Ullman):

For each subtree minimize the number of needed registes:

evaluate **first the subtree that needs most** registers

assume the results of  $T_I$  and  $T_r$  are in registers

eval. order needed registers b =

 $T_l$   $T_r$  op  $\max (b_l, b_r + 1)$   $\prod$  minimize  $T_r$   $T_l$  op  $\max (b_r, b_l + 1)$ 

number of available registers (regmax) is upper limit for needed registers

### Lecture Compilation Methods SS 2013 / Slide 404

### **Objectives:**

Select evaluation order determines number of needed registers

### In the lecture:

- Show that evaluation order determines the number of registers needed for a subtree.
- Explain the computation of needed registers.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.3

#### **Assignments:**

• Apply the technique for several register classes.

© 2006 bei Prof. Dr. Uwe Kastens

### **Lecture Compilation Methods SS 2013 / Slide 405**

### **Objectives:**

Tree attribution in phases

### In the lecture:

- Explain the spill code situation.
- Explain the example.
- Explain in attribute grammar terminology.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.3

### **Questions:**

- Assume that in an expression tree spill code is generated at 2 nodes. Where are these nodes?
- Specify the technique by an attribute grammar.

# Contiguous code vs. optimal code

The method assumes that the code for every subtree is contiguous. (I.e. there is no interleaving between the code of any two disjoint subtrees.)

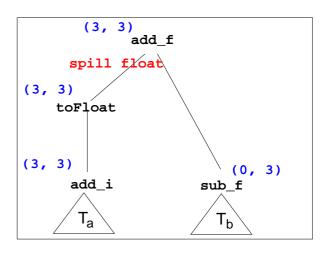

The method is optimal for a certain configuration of registers and operations, iff every optimal evaluation code can be arranged to be contiguous.

### Counter example:

Registers: 3 int and 3 float Register need: (i, f) from (0, 0) to (3, 3)

Operations: int- and float- arithmetic,

toFloat (widening)

register use:

(3, 3)

(1, 0)

(0, 1)

(0, 0) (0, 3)

toFloat

(0, 1)

(0, 2)(0, 1)

contiguous:

Ta add\_i toFloat store\_f

T<sub>b</sub> sub\_f load\_f

add f

optimal:

T<sub>a</sub> add\_i

T<sub>b</sub> sub\_f

add\_f

register use:

(1, 0) (1, 3)(3, 3)

(1, 1)

(1, 2)(0, 1)

### Lecture Compilation Methods SS 2013 / Slide 405a

### **Objectives:**

Understand the optimality condition

### In the lecture:

- Explain the condition for optimality.
- Explain the counter example.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.3

# 4.2 Register Allocation for Basic Blocks by Life-Time Analysis

Lifetimes of values in a basic block are used to minimize the number of registers needed.

1st Pass:

Determine the **life-times** of values: from the definition to the last use (there may be several uses!).

Life-times are represented by intervals in a graph

cut of the graph = number of registers needed at that point

### at the end of 1st pass:

maximal cut = number of register needed for the basic block allocate registers in the graph:

In case of shortage of registers: select values to be spilled; criteria:

- a value that is already in memory store instruction is saved
- the value that is latest used again

2nd Pass: allocate registers in the instructions; evaluation order remains unchanged

The technique has been presented originally 1966 by

Belady as a paging technique for storage allocation.

### Lecture Compilation Methods SS 2013 / Slide 406

### **Objectives:**

Specify life-time and register need by interval graphs

### In the lecture:

- Explain the technique using the example of C-4.7; show its characteristics:
- reused intermediate results,
- · evaluation order remains unchanged,
- interpretation as a paging technique.

#### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.2

#### **Questions:**

- Explain the criteria for selecting values to be spilled.
- Explain the technique in terms of memory paging.

© 2011 bei Prof. Dr. Uwe Kastens

### **Lecture Compilation Methods SS 2013 / Slide 407**

### **Objectives:**

Example for C-4.6

### In the lecture:

Explain

- the example,
- the variants of allocation,
- the application of the selection criteria.

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.2, Abb. 7.5-3

### **Assignments:**

• Apply the technique for another example.

### **Questions:**

• Explain the alternatives (b) and (c).

# 4.3 Register Allocation by Graph Coloring

Definitions and uses of variables in control-flow graphs for **function bodies** are analyzed (DFA). Conflicting life-times are modelled. Presented by **Chaitin**.

### Construct an interference graph:

**Nodes:** Variables that are candidates for being kept in registers

Edge {a, b}: Life-times of variables a and b overlap

=> a, b have to be kept in different registers

Life-times for CFGs are determined by data-flow analysis.

### Graph is "colored" with register numbers.

NP complete problem; **heuristic technique** for coloring with k colors (registers):

eliminate nodes of degree < k (and its edges)

if the graph is finally empty:

graph can be colored with k colors

assign colors to nodes in reverse order of elimination

else

graph can not be colored this way

select a node for spilling

repeat the algorithm without that node

### Lecture Compilation Methods SS 2013 / Slide 408

#### **Objectives:**

Overlapping life-times modelled by interference graphs

### In the lecture:

- Explain the interference graph using the example of C-4.9.
- Demonstrate the heuristics.

#### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.4

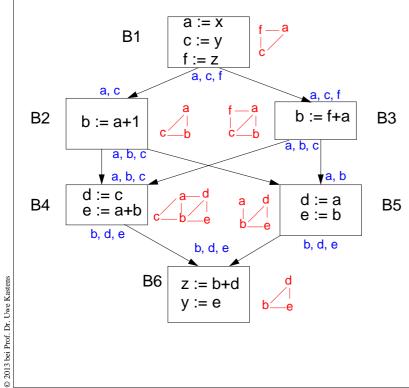

#### **Questions:**

- Why is DFA necessary to determine overlapping life-times? Why can't one check each block separately? Give an example where that simplified approach would yield wrong results.
- $\bullet\,$  Show a graph that is k-colorable that is not colored successfully by this heuristic.

© 2011 bei Prof. Dr. Uwe Kastens

# **Example for Graph Coloring**

### CFG with definitions and uses of variables

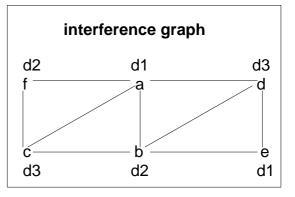

variables in memory: x, y, z

variables considered for register alloc.: a, b, c, d, e, f

results of live variable analysis:

b, d, e

### Lecture Compilation Methods SS 2013 / Slide 409

### **Objectives:**

Example for C-4.8

### In the lecture:

Explain the example

### Suggested reading:

Kastens / Übersetzerbau, Section 7.5.4, Fig. 7.5-6

### **Assignments:**

• Apply the technique for another example.

### **Questions:**

• Why is variable b in block B5 alive?
